

SEO Status & Priority Report

Olivia Alleppey · oliviaalleppey.com · 18 August 2026
Follow-up to the SEO Implementation Report of 5 August 2026

Summary

The technical foundation laid on 5 August is holding, and three of the follow-up items have since shipped: analytics, the `www` canonical correction, and internal links to `/about` . Verified again today against the current codebase.

The site is no longer blocked by code. It is blocked by two things that only Olivia can authorise — **Google Search Console verification** and the **Google Business Profile** — and by the absence of any content that targets destination search. Until the first two are done, the site is publishing into the dark: there is no way to see which queries reach it, which pages are indexed, or whether any of the August work moved a ranking.

A note on what this report does not contain. There are no keyword rankings, impression counts, or click-through figures in this document, because none exist yet. Search Console has not been verified, so Google has published no data about this site to us. Any numbers of that kind would be invented, and would be worse than no numbers at all. Item 1 below is what unlocks them, and it takes about ten minutes.

1. Shipped since the last report

Item	What was done	Status
Analytics	GA4 installed with Consent Mode v2 and single-page-app page-view tracking, so route changes register as page views. Property <code>G-DJWY37H5V5</code> .	DONE
Canonical host	Canonicals were pointing at the apex domain, which 301s to <code>www</code> . Every canonical and sitemap URL now names <code>www.oliviaalleppey.com</code> , the host actually served.	DONE
<code>/about</code> orphan page	Now linked from the footer and from two homepage sections. It is reachable by crawlers and can accumulate internal link equity.	DONE
Image alt text	Re-audited today: 47 images across the public site, zero missing alt attributes . Six remain generic, five of which are logos where generic is acceptable.	CLOSED
Meta Pixel	Installed and gated on cookie consent. Marketing attribution, not SEO, but it shares the consent plumbing.	DONE

2. Current state — verified today

Check	Result	Detail
-------	--------	--------

Sitemap present and populated	PASS	35 URLs, database-driven
robots.txt correct	PASS	Admin, API and booking funnel excluded
Canonical on every page, self-referencing	PASS	On <code>www</code>
Structured data	PASS	Hotel, HotelRoom, Restaurant, EventVenue, FAQPage, BreadcrumbList, WebSite
Page metadata coverage	PASS	20 public pages, all with title, description, OG and Twitter tags
Exactly one H1 per public page	PASS	—
Image alt coverage	PASS	47 of 47
Analytics installed	PASS	GA4 + Consent Mode v2
Search Console verified	FAIL	No verification tag anywhere in the codebase
Geo coordinates in Hotel schema	FAIL	Absent from <code>lib/structured-data.ts</code>
Review / rating schema	FAIL	No <code>aggregateRating</code> or <code>review</code> anywhere
Meta descriptions within 160 characters	FAIL	12 of 20 exceed it
Static rendering of marketing pages	FAIL	All routes still rendered on demand
Non-brand / destination content	FAIL	No blog, guide or location pages exist

3. Critical items — do these first

P0 1. Search Console is still not verified

There is no `google-site-verification` tag in the site's metadata, which means the domain has never been verified. The consequence is total: the sitemap has never been submitted, the twelve pages recovered from 404 in August have never been offered to Google for re-indexing, and no one can see a single query, impression, click or indexing error.

GA4 shows what visitors do *after* they arrive. Only Search Console shows how they found the site, or whether Google can see it at all. Two weeks of the August work are currently unmeasured.

Owner: Olivia to sign in and verify; we install the tag and submit the sitemap. · **Effort:** ~10 minutes on your side, under an hour on ours.

P0 2. Google Business Profile is the largest single lever, and it is off-site

For a five-star property in Alappuzha, the local pack and Google Maps sit above the organic results for the searches that actually convert — "hotels in Alleppey", "5 star hotel Alappuzha", "backwater resort near me". Those placements are driven almost entirely by a claimed, complete, actively-reviewed Business Profile, not by the website's code.

No amount of on-site work substitutes for this. It cannot be done from the codebase and cannot be delegated without account access.

Owner: Olivia. · **Needed:** claim or confirm the listing, then complete hours, amenities, category, booking link and photos.

P0 3. The Hotel schema has no geo coordinates

Confirmed absent today. The `Hotel` block carries the address, phone numbers, star rating, room count and amenities, but no `GeoCoordinates`. This is the field that ties the structured data to a physical point and reinforces the Business Profile listing.

This was deliberately left blank rather than guessed — wrong coordinates place the hotel in the wrong spot on a map, which is worse than none. We need the exact latitude and longitude, which can be read straight off the Business Profile listing.

Owner: Olivia supplies the coordinates; we ship it the same day. · **Blocked on:** item 2.

P0 4. No review or rating schema — the missing star rating

There is no `aggregateRating` or `review` markup on the site. This is the single highest-value structured-data type for a hotel: it is what produces the gold stars and review count under a search result. Two results side by side, one with stars and one without, do not attract clicks equally.

It requires genuine, first-party guest reviews to be collected and displayed on the site. Marking up ratings the site does not actually show, or borrowing them from a third-party platform, breaches Google's guidelines and risks a manual action — so this needs a real review pipeline, not a markup shortcut.

Owner: joint — Olivia decides the review source, we build the collection and display. · **Effort:** the largest item on this list.

4. High priority

P1 5. The homepage H1 is a slogan, not a search signal

It still reads "**Experience The Unexperienced**". The H1 on the homepage is the strongest single on-page ranking signal the site has, and it is currently spent on a phrase nobody searches for. The page title and metadata already say "Luxury 5-Star Hotel in Alappuzha, Kerala" — the visible heading contradicts them.

The fix is a heading that names what the property is and where it is, with the brand line kept as the subheading directly beneath it. Nothing is lost visually; the slogan stays on the page. This is a brand-voice decision, so it is Olivia's call, not ours — but it is the highest-value copy change available.

Owner: Olivia approves the wording; we implement. · **Effort:** minutes, once approved.

P1 6. Twelve of twenty meta descriptions will be truncated

Google cuts descriptions at roughly 155–160 characters. Twelve of the twenty public pages exceed that, some substantially — `/conference-events` runs to 200 characters, so its closing sentence never reaches a searcher. The homepage runs to 178.

The description does not affect ranking, but it is the sales copy in the result. A sentence that ends mid-word costs clicks on traffic already earned.

Page	Description length	Over by
<code>/conference-events</code>	200	40
<code>/dining</code>	191	31
<code>/discover</code>	189	29
<code>/rooms</code>	183	23
<code>/wedding</code>	179	19
<code>/</code> (homepage)	178	18

...and six more between 161 and 169 characters.

Owner: us, with Olivia's sign-off on the rewritten copy.

P1 7. Every page is still rendered on demand

Carried over from the last report and still true. `auth()` runs in the root layout and reads cookies, which forces every route — including purely static marketing pages — to be server-rendered on each request. The marketing pages have no reason to be dynamic.

The cost is time-to-first-byte on every visit, which feeds directly into Core Web Vitals, and crawl efficiency: a slow server response reduces how much of the site Google will fetch per visit. The fix is an authentication change — moving the session read out of the root layout — which is why it was excluded from an SEO pass and needs scheduling on its own.

Owner: us. · **Effort:** a focused piece of work, with regression testing across signed-in flows.

P1 8. The site can only be found by people who already know the name

Every page on the site describes the property itself. There is no content targeting the searches people make *before* they have chosen a hotel — backwater cruises, houseboat routes, Alappuzha beach, what to do in Alleppey, when to visit Kerala, how to get there from Kochi airport.

That means the site competes only on brand search, where it will always win, and cedes destination search entirely to OTAs and travel blogs — which then resell the property back at commission. This is the difference between a site that confirms a decision already made and one that creates the decision.

Owner: joint — needs an agreed content plan and a writer. · **Horizon:** the slowest item here to pay off, which is exactly why it should start soonest.

5. Medium priority

Item	Detail	Owner
------	--------	-------

No <code>hreflang</code>	The site declares a single locale, <code>en_IN</code> , while operating dedicated reservation desks for both India and Dubai. If the Gulf market matters commercially, the site currently gives search engines no signal that it serves it.	Olivia decides if it matters
<code>/shop</code> is <code>noindex</code>	Deliberately excluded from search during the August pass. If the shop is meant to sell to strangers rather than existing guests, that decision should be revisited.	Olivia decides
Six generic alt texts	Five are logos, where generic text is correct. One is a misspelling — "Olivia ALleppey" on the invoice logo. Cosmetic, on a <code>noindex</code> page, but it is the brand name.	Us
Trading name still split	Unresolved from the last report. Public pages say "Olivia Alleppey"; the schema <code>legalName</code> says "Olivia International Hotel". Consistent naming across the site, the schema and the Business Profile is a genuine local-search signal.	Olivia confirms
Internal linking depth	Room, dining and venue detail pages are reachable from their hubs, but rarely link to each other. Cross-links between related pages spread authority and keep crawlers moving through the site.	Us

6. Suggested sequence

Window	Work	Depends on
This week	Verify Search Console, submit the sitemap, request indexing on the recovered pages. Claim or confirm the Google Business Profile. Send us the coordinates.	Olivia
Weeks 2–3	Ship the geo coordinates. Rewrite the twelve long meta descriptions. Agree and ship the homepage H1. Fix the alt-text typo and add cross-links between detail pages.	Items above
Weeks 4–6	Move <code>auth()</code> out of the root layout and get the marketing pages statically rendered. Measure the before-and-after in Search Console, which by then will have data.	Scheduling
Weeks 6–12	Build the guest review pipeline and add rating schema. Publish the first destination pages. Read the first real query data and let it direct the next round.	Content plan

7. What we need from you

Ordered by how much each unblocks. The first two gate almost everything else in this report.

#	What	Why
1	Google Search Console access, or sign in and send us the HTML verification tag	Nothing can be submitted, monitored or diagnosed without it. The sign-in is yours to perform; we install the tag.
2	Google Business Profile — claimed, or confirmation that it already is	The largest lever available to a hotel in local search, and entirely outside the website.

3	Exact latitude and longitude of the property	To complete the Hotel schema. Read it off the Business Profile listing. We will not guess it.
4	Approval on the homepage H1 wording	A brand-voice call. We will propose two or three options if that is easier than starting from blank.
5	Confirmation of the trading name split	Whether "Olivia Alleppey" publicly and "Olivia International Hotel" legally is intended.
6	A decision on guest reviews — where they are collected and whether they go on the site	Prerequisite for rating stars in search results.
7	Whether the Gulf market justifies separate localisation	Determines whether <code>hreflang</code> and a Dubai-facing page are worth building.

8. How this was verified

- Every claim above was checked against the codebase on 18 August 2026, not carried forward from the previous report.
- Structured data inspected in `lib/structured-data.ts`: `geo`, `aggregateRating` and `review` confirmed absent.
- Metadata coverage and lengths measured across all 20 public pages by parsing every `pageMetadata` call.
- Alt-text audit parsed all 47 `<Image>` and `<img>` tags on public routes; none lacked an alt attribute.
- Search Console verification searched for across the root layout and SEO config; no tag present.
- Redirects, robots rules and sitemap route confirmed in `next.config.ts`, `app/robots.ts` and `app/sitemap.ts`.
- Shipped items confirmed against the commit history since 5 August.

Prepared for Olivia Alleppey · 18 August 2026 · Companion to the SEO Implementation Report of 5 August 2026. No ranking or traffic figures are included in this report because Search Console has not yet been verified and no such data exists.
