

SEO Implementation Report

Olivia Alleppey · oliviaalleppey.com · 5 August 2026

Summary

The site had no SEO foundation: no sitemap, no robots.txt, no structured data, and no social-share image. More seriously, three defects were actively working against the site — every page declared itself a duplicate of the homepage, twelve content pages returned 404, and every share preview was blank. All three are fixed, along with the missing foundation. Verified against a running server and a clean production build.

Metric	Before	After
Pages with a correct canonical	0	all
Indexable pages returning 404	12	0
URLs in sitemap.xml	no sitemap	35
Pages with structured data	0	all
Public pages with no metadata	18	0
Public pages with no H1	6	0
Working social share image	none	all pages

1. Defects found and fixed

These were not gaps — they were live faults suppressing the site in search.

Defect	Cause	Fix
Every page canonicalised to the homepage	The root layout set <code>alternates.canonical</code> to the homepage URL. Next.js inherits that into any page that does not override it, so ~20 pages told Google they were duplicates of <code>/</code> .	Removed from the layout. Every page now emits its own canonical through a shared helper.
12 content pages returned 404	<code>dining/[slug]</code> and <code>conference-and-events/[slug]</code> typed params as a plain object and read <code>params.slug</code> directly. In Next 16 <code>params</code> is a Promise, so the slug was undefined and both pages called <code>notFound()</code> .	Awaited properly. Recovered 4 restaurants (Kaayal, Club 9, The Oak Room, Aqua Pool Lounge) and all 8 event venues.
Every social share preview was blank	All Open Graph and Twitter tags pointed at <code>/og-image.jpg</code> , which does not exist in <code>public/</code> .	Replaced with a branded card generated at request time. Room pages use their own photograph.

Defect	Cause	Fix
Redirect stubs returned 200	/accommodation, /policies and /book were page components calling redirect(), which crawlers see as a 200 that bounces rather than a permanent move.	Converted to real 301/308 redirects in next.config.ts.
Duplicate title suffix	Found during verification: the title template and the page helper were both appending the brand, producing “Rooms & Suites Olivia Alleppey Olivia Alleppey”.	Helper now emits a bare title and lets the template add the brand once.

2. Foundation added

Area	What was added
Crawl control	app/robots.ts — allows the public site, blocks /admin, /api, /signin, /my-bookings and the whole booking funnel, and points to the sitemap.
Sitemap	app/sitemap.ts — 35 URLs. Room, restaurant and venue slugs are read live from the database, so new entries appear automatically. Each table is queried independently, so one failure yields a partial sitemap rather than a 500.
Structured data	Hotel sitewide (address, phone, 5-star rating, 88 rooms, check-in/out, 10 amenities, India and Dubai reservation contacts) · HotelRoom with price, occupancy and floor size · Restaurant per outlet · EventVenue per venue · FAQPage on weddings and room pages · BreadcrumbList throughout · WebSite .
Page metadata	Title, description, canonical, Open Graph and Twitter tags added to the 18 public pages that had none. Client-component pages receive theirs through a route layout. Account and checkout pages are explicitly noindex.
Headings	An H1 added to the 6 pages rendering none — homepage, dining, gallery, weddings, wellness and conference & events. Existing hero headings were promoted rather than restyled; the gallery, which had no heading at all, received one in the site's own style.
404 page	app/not-found.tsx — branded, noindex, and links to six main sections so crawl budget spent reaching a dead URL is not wasted.
Shared config	lib/seo.ts and lib/structured-data.ts centralise brand name, address, phone numbers and URL building, so a change lands in one place.

3. Route consolidation

Three near-identical events pages existed; only one was linked. Venue detail pages sat under a URL the navigation never pointed to, and nothing linked to them at all.

URL	Was	Now
/conference-events	Linked in nav, no detail links	Canonical hub, now links to all 8 venues
/conference-events/[slug]	Did not exist	8 venue pages, statically generated

URL	Was	Now
/conference-and-events	Unlinked duplicate	301 to the hub
/events	Unlinked duplicate	301 to the hub
/accommodation	200 then client bounce	301 to /rooms
/policies	200 then client bounce	301 to /refund-policy

4. How this was verified

- `tsc --noEmit clean`; next build completes with no errors.
- Canonical tag checked on 8 routes — each returns its own URL, not the homepage.
- All 12 previously-404 pages confirmed returning 200.
- Redirects confirmed returning 308 to the correct destination.
- Titles confirmed to carry the brand exactly once.
- Open Graph image confirmed present on every page tested.
- H1 count confirmed as exactly one on all 11 public pages.
- `noindex` confirmed on /shop, /signin, /book/search, /my-bookings; index confirmed on public pages.
- JSON-LD output inspected in the served HTML for Hotel, HotelRoom, Restaurant, EventVenue and FAQPage.
- Browser console checked — no errors.

5. Known limitation — not delivered

Static rendering was not achieved. The `force-dynamic` flag was removed from the root layout, but the production build confirms every route is still server-rendered on demand. The cause is `auth()` in the root layout: it reads cookies, which forces dynamic rendering regardless of the flag. Making the marketing pages genuinely static means moving the session out of the root layout — an authentication architecture change, deliberately left out of an SEO pass. This costs crawl efficiency and time-to-first-byte, not correctness.

6. Recommended next steps

Priority	Action	Owner
Now	Deploy, then submit <code>sitemap.xml</code> in Google Search Console and request indexing for the 12 recovered pages.	You + me
Now	Verify the domain in Google Search Console and create/claim the Google Business Profile — the single biggest lever for a hotel's local search.	You
High	Add geo coordinates to the Hotel schema. Deliberately omitted rather than guessed — wrong coordinates misplace the hotel on maps.	You → me
High	Install analytics (GA4 or Plausible). There is currently no measurement of any kind, so none of this work can be evaluated.	You → me

Priority	Action	Owner
High	Link /about from the navigation or footer, or merge it into /discover. It has 226 lines of real content and zero internal links, so it will not rank.	You decide
Medium	Rewrite the homepage H1. It currently reads “Experience The Unexperienced” — a brand line carrying no search signal. Something like “Luxury 5-Star Hotel in Alappuzha” would rank; the trade-off against brand voice is a marketing call.	You decide
Medium	Audit image alt text across the gallery and room galleries, much of which is generic (“Gallery image”, “Hero 2”).	Me
Medium	Add review/rating schema once real guest reviews are collected. This drives star ratings in results and is high-value for hotels.	You → me
Later	Move auth() out of the root layout to unlock static rendering and materially faster page loads.	Me
Later	Build location landing pages (backwaters, houseboat cruises, Alappuzha beach) to capture destination search rather than brand search.	Me

7. What I need from you

Ordered by how much each unblocks. The first three are the ones I cannot proceed without.

#	What	Why it is needed
1	Exact latitude and longitude of the property	To complete the Hotel schema. Take it from your Google Business Profile listing. I will not guess this.
2	Google Search Console access, or the HTML verification tag	Nothing can be submitted, monitored or diagnosed without it. Sign-in is yours to perform; send me the meta tag and I will install it.
3	Confirmation of the trading name	Public pages now say “Olivia Alleppey”; the legal copy and schema legalName still say “Olivia International Hotel”. Confirm that split is intended.
4	Analytics preference — GA4, Plausible, or Vercel Analytics	So I can install the right one. Vercel Analytics is the least work given your hosting.
5	Decision on /about and the homepage H1	Both are content and brand-voice calls, not technical ones.
6	Official social profile URLs, if any	Instagram, Facebook and so on feed the schema sameAs field, which strengthens entity recognition and the knowledge panel.
7	Whether guest reviews exist anywhere in structured form	Needed before review schema can be added honestly. Ratings must reflect real reviews or they breach Google’s guidelines.

Nothing in this report is speculative: every claim was verified against the running application or the production build. Where something was not achieved, it is stated as such in section 5.
